Classification of Regions with WPE

Eduarda Chagas

May 2, 2020

In this script, we will evaluate the performance of the WATG technique for region classification in PolSAR textures.

###Importing the packages

```
# Load some packages:
if(!require(caret)) install.packages("caret")
```

```
## Loading required package: caret
```

```
## Loading required package: lattice
```

```
## Loading required package: ggplot2
```

```
if(!require(MLmetrics)) install.packages("MLmetrics")
```

```
## Loading required package: MLmetrics
```

```
##
## Attaching package: 'MLmetrics'
```

```
## The following objects are masked from 'package:caret':
##
##     MAE, RMSE
```

```
## The following object is masked from 'package:base':
##
##     Recall
```

```
setwd("/home/eduarda/Desktop/Repositories/SAR/SAR-WATG-master/Code/Classification")
```

###Importing the dataset

For this analysis, three SAR images with different regions were used, they are:

- Sierra del Lacandon National Park, Guatemala (purchased April 10, 2015), available at [https://uavsar.jpl.nasa.gov/cgi-bin/product.pl?jobName=Lacand_30202_15043_ 006_150410_L090_CX_01 # data] (https://uavsar.jpl.nasa.gov/cgi-bin/product.pl?jobName=Lacand_30202_15043_006_150410_L090_CX_01 # data);
- Oceanic regions of Cape Canaveral (acquired on September 22, 2016);
- Urban area of the city of Munich, Germany (acquired on June 5, 2015).

A total of 160 samples were considered during the investigation, with 40 forest regions in Guatemala, 80 ocean regions in Cape Canaveral and 40 urban regions in the city of Munich.

```
n.total = 160
regions = c(rep("Forest",40), rep("Sea",80), rep("Urban", 40))

Entropy.Complexity = data.frame("Entropy" = numeric(n.total),
```

```
                                "Complexity" = numeric(n.total),
                                "Region" = character(n.total),
                                stringsAsFactors=FALSE)

Entropy.Complexity.csv = read.csv(file="../../Data/EntropyComplexityWPED3T1.csv",
                                  header=TRUE, sep=",")
Entropy.Complexity$Entropy = Entropy.Complexity.csv[,1]
Entropy.Complexity$Complexity = Entropy.Complexity.csv[,2]
Entropy.Complexity$Region = regions

split = 0.85
trainIndex = createDataPartition(Entropy.Complexity$Region, p = split, list = FALSE)

x = data.frame(Entropy.Complexity$Entropy[trainIndex], Entropy.Complexity$Complexity[trainIndex])
y = factor(Entropy.Complexity$Region[trainIndex])

x_validation = data.frame("Entropy" = Entropy.Complexity$Entropy[-trainIndex], "Complexity" = Entropy.C
y_validation = factor(Entropy.Complexity$Region[-trainIndex])

Entropy.Complexity = data.frame("Entropy" = Entropy.Complexity$Entropy[trainIndex],
                                "Complexity" = Entropy.Complexity$Complexity[trainIndex],
                                "Region" = Entropy.Complexity$Region[trainIndex],
                                stringsAsFactors=FALSE)
```

##KNN Classifier

###Creating KNN model and predicting

```
set.seed(123)
ctrl = trainControl(method="repeatedcv", number = 10, repeats = 10)
knnFit = train(Region~., data = Entropy.Complexity, method = "knn",
               trControl = ctrl,
               preProcess = c("center","scale"),
               tuneLength = 20)

pred = predict(knnFit, newdata = x_validation)
#knnFit$results

xtab = table(pred, y_validation)
confusionMatrix(xtab)
```

```
## Confusion Matrix and Statistics
